PROJECT

Fully automated smart crop field protection system against numerous behaviours of wild animals

The main objective of this project is to protect the Crop field from different sources of distraction due to wild animals.

This project presents the development of smart sensor based environment monitoring system in remote villages especially for crop field. The microcontroller now sounds an alarm to woo the animals away from the field as well

so that he may know about the issue and come to the spot in case the animals do not turn away by the alarm. This ensures complete safety of crops from animals thus protecting the farmers.
